

## Unicode Cataloging Done Right

### A trusted name with powerful new features

The new BiblioFile is state of the art cataloging. It includes the context sensitive Cataloger's Reference Shelf, powerful data manipulation features, local database and authority processing control, MARC record validation, macro scripting language, data manipulation for bibliographic and authority records, label printing and other advanced features not found in any other cataloging program. BiblioFile is the first choice of the professional cataloging organizations where productivity and quality standards are most demanding.

### Office Suite Features Extended

BiblioFile takes full advantage of Windows® Multilingual User Interface (MUI) technology to incorporate and extend Office Suite style features. For example, BiblioFile makes creative use of the user's Windows Regional and Language Options settings to display Unicode characters without changing fonts.

### Additional Features:

- Full ISBN-13 support
- A search dialog with Find or Browse searching, three-element Boolean support, 37 access points, and pre-configured support for searches of U.S. National Profile compliant Z39.50 servers. BiblioFile remembers your default search preferences and preferred data sources.
- Diacritics that appear as they will appear in your OPAC and that support all Unicode characters specified in MARC21.
- Enhanced result set display. Add, remove, group, collapse, resize, or sort any column.
- New indexes. Find Any searches all text and numeric fields. Standard Number searches numeric fields, plus 19 other new indexes.
- Instant MARC21 validation as you type.
- Automatic Unicode conversion to and from MARC-8 files.
- Information panes that provide instant feedback on critical processes, including MARC 21 and OCLC validation, search progress, and authority verification. Panes can be undocked and displayed on a second monitor, if the user's hardware supports it.
